MAXIMUM KNOWN STAGES AND DISCHARGES

OF NEW YORK STREAMS

Through 1967

by

Bernard Dunn

FOREWORD

Systematic investigations of the water resources of New York have been carried on since about 1900 under cooperative agreement between the State of New York, and the United States Department of Interior, Geological Survey. An important part of the work has been the determination of maximum stages and rates of discharge at regular gaging stations, partial record stations, and at other locations where data became available following floods.

This report represents a compilation of all known maximum stages and discharges in the files of the Geological Survey, including a limited amount of data furnished by other Federal, State, and private organizations. This compilation is an updating of New York State Water Resources Commission Bulletin 54 dated March 1965.

The data presented in this report are tabulated under the heading of the major river or lake basin in which the stream is located. To facilitate use of this report, the U.S. Geological Survey downstream order number is given for each entry. Under this system, if a tributary stream enters between two main-stem sites it is listed between them. The county in which the measuring site is located as well as the nearest village or city is listed. In this report the period of record begins with the first calendar year and ends with the last calendar year for which a peak discharge is In most cases there are also peaks for each of the intervening The gage height is the height of the peak water surface above an arbitrarily established datum. The mean sea-level elevation of the peak is also listed for sites where the gage datum is referenced to mean sea level. The unit runoff, in cubic feet per second per square mile (csm), is obtained by dividing the peak discharge, in cubic feet per second (cfs), by the drainage area, in square miles. Under the "Remarks" column, code numbers provide additional information about that entry.

The information in this computerized report is necessarily condensed and standardized to the greatest extent possible. If more detailed information is needed for any specific site it is suggested that you contact the U.S. Geological Survey, P. O. Box 948, Albany, N. Y. 12201.

Users of this report are invited to submit evidence of peak stages and discharges at sites not listed in this compilation, or of peak stages and discharges which are known to exceed those listed herein.

Peak stages and discharges at gaging stations, partial-record stations, and miscellaneous sites are published in an annual series of the U.S. Geological Survey entitled "Water Resources Data for New York - Part 1. Surface Water Records."

The data contained in this report are complete through the 1967 water year (ending September 30, 1967).

This report was prepared by the U.S. Geological Survey in cooperation with the New York State Department of Transportation and the New York State Conservation Department, Division of Water Resources. The computer format of this report has been made possible through the effort of Charles E. Carlson, Director, and Mrs. Janet R. Nelson, Programmer, Electronic Data Processing Bureau of the New York State Department of Transportation.
